DIVISION: 03 00 00—CONCRETE
Section: 03 31 00—Structural Concrete

REPORT HOLDER:
HELIX® STEEL

EVALUATION SUBJECT:
HELIX® 5-25 MICRO REBAR™ & HELIX® 5-25U MICRO REBAR™ REINFORCEMENTS

1.0 EVALUATION SCOPE
Compliance with the following codes:
- 2018 International Building Code® (IBC)
- 2018 International Residential Code® (IRC)
- 2013 Abu Dhabi International Code (ADIBC)†

†The ADIBC is based on the 2009 International Building Code. 2018 IBC code sections referenced in this report may be considered as equivalent sections under in the ADIBC.

Properties evaluated:
- Durability
- Structural
- Crack control

2.0 USES
Helix® Micro Rebar™ reinforcements (Helix® 5-25 Micro Rebar™ and Helix® 5-25U Micro Rebar™) are used as alternatives to the shrinkage and temperature reinforcement specified in Section 24.4 of ACI 318 for plain concrete footings and for plain concrete slabs (as defined by ACI 360) supported directly on the ground.

Helix® Micro Rebar™ reinforcements are also used to increase the modulus of rupture for the design of structural plain concrete using linear elastic design in applications within the scope of ACI 318 Chapter 14, IBC Section 1906 and ACI 332 Section 8.2.1, IRC Sections R404.1.3 and R608.1, or Tables 8.2.1.3a and 8.2.1.3b of ACI 332.

Helix® Micro Rebar™ reinforcements are also used as an alternative to horizontal temperature and shrinkage reinforcement in structural plain concrete walls as described in IBC Section 1906, IRC Sections R404.1.3 and R608.1, and ACI 332 Sections 8.2.1 and 8.2.7.

Helix® Micro Rebar™ reinforcements also apply to slabs-on-ground applications that are designed in accordance with Chapter 7 or Chapter 11 of ACI 360.

Helix® Micro Rebar™ reinforcements also apply to plain concrete parking lot applications that are designed in accordance with Chapter 3 of ACI 330.

Under the IRC, an engineered design in accordance with IRC Section R301.1.3 must be submitted to the code official for approval, except in the following cases:

1. Below grade walls designed in accordance with the requirements of Table 3 of this report.
2. When Helix 5-25 is used at a dosage rate of 9 lb/yd³ (5.4 kg/m³) to replace temperature and shrinkage reinforcement in footings in Seismic Design Categories A, B and C meeting the requirements of IRC Section R403.1.1.

3.0 DESCRIPTION
Helix® Micro Rebar™ reinforcements are made from minimum 240 ksi (1650 MPa), 0.020 in +/-0.007 in (0.51 mm +/- 0.02 mm) cold drawn steel wire. Each Helix® Micro Rebar™ has a minimum of one 360-degree twist. Helix® Micro Rebar™ reinforcement is used in dosages between 9 lb/yd³ and 34.5 lbs/yd³ (5.4 kg/m³ and 21 kg/m³). Helix® 5-25 is electroplated with zinc; whereas, Helix® 5-25U is uncoated.

3.1 Structural Plain Concrete: Structural normal-weight plain concrete must comply with Section 1906 of the IBC. Concrete design must follow ACI 211.1 and ACI 318 Section 26.12.3.1 with specified compressive strength, fc’, between 3000 psi and 5000 psi (21 MPa and 35 MPa) [minimum 24 MPa is required under ADIBC Appendix L, Section 5.1.1].

4.0 DESIGN & INSTALLATION
4.1 Type N (Temperature and Shrinkage): Helix® Micro Rebar™ reinforcements are used as an alternative to shrinkage and temperature reinforcement specified in Section 24.4 of ACI 318 for plain concrete footings and for plain concrete slabs (as defined by ACI 360) supported directly on the ground for dosage rates between 9 lb/yd³ and 34.5 lbs/yd³ (5.4 kg/m³ and 21 kg/m³).

4.2 Type S (Linear Elastic Design): Type S applications fall within the scope of ACI 318 Chapter 14, IBC Section 1906 and ACI 332 Section 8.2.1, IRC Sections R404.1.3 and R608.1, or Tables 8.2.1.3a and 8.2.1.3b of ACI 332. Design for flexure in accordance with Section 4 of this report must be limited in capacity by the values presented in Table 1 and Equations 1 or 2, and all designs must be verified to meet the criteria of ACI 318 Section 14.1.3 excluding slabs on grade (e.g. slabs designed per ACI 360 Chapter 7.2.1 PCA method where only flexural capacity is required).
a) For pure flexure
\[ M_u \leq \lambda_s \varphi L_f \sqrt{f'_c} S_m \quad \text{(Equation 1)} \]
b) For combined flexure and axial compression
\[ \frac{M_u}{S_m} - \frac{P_u}{A_g} \leq \lambda_s \varphi L_f \sqrt{f'_c} \quad \text{(Equation 2)} \]

Where
\( L_f \sqrt{f'_c} \) = Maximum limit for flexural capacity.
\( M_u \) = Ultimate moment, lb.-in.
\( P_u \) = Ultimate axial load, lb.
\( S_m \) = Section modulus, in\(^3\).
\( A_g \) = Gross section area, in\(^2\).
\( f'_c \) = Compressive strength as defined in ACI 318-14 26.12.3.1 and ACI 214R.
\( \varphi \) = Strength reduction factor as reported in Table 1 for Type S.
\( \lambda_s \) = Scale-effect adjustment factor per Table 2 of this report, or computed using Equation 3 by a registered design professional (RDP).

\[ \lambda_s = \frac{2.5 \left( \frac{h_0}{h_a} \right)^{0.7}}{1+1.5 \left( \frac{h_0}{h_a} \right)^{0.8}} \quad \text{(Equation 3)} \]

Where:
\( h_0 \) = depth of member being designed.
\( h_a \) = depth of test beam 6.0 in (150 mm).

Axial compression and shear capacity, when required for design, must be based on the requirements of Sections 14.5.3 and 14.5.5 of ACI 318, respectively. Resistance to lateral forces, as part of a lateral force resisting system, must be based on the requirements of ACI 318, Chapter 14. Connections between members must be based on ACI 318, Chapter 16, Provisions of Section 14.6.1 of ACI 318-14, IRC Section R608.8.1, and Section 8.2.7 (g) of ACI 332 must apply.

4.3 Type G (Design Limits for Slabs-on-Ground):

4.3.1 Plain Concrete Method: When the modulus of rupture is required for plain concrete slabs-on-ground design in accordance with ACI 360, Chapter 7, the modulus of rupture \( (f_r) \) must be applied using Equation 4 and the values presented in Table 1:

\[ f_r = L_f \sqrt{f'_c} \quad \text{(Equation 4)} \]

4.3.2 Fiber Reinforced Concrete Slabs-on-Ground: When the modulus of rupture is required for plain concrete slabs-on-ground design using the Elastic method or Yield Line Method in accordance with ACI 360, Sections 11.3.3.2 and 11.3.3.3, respectively, the modulus of rupture \( (f_r) \) must be taken as Equation 4 using the values presented in Table 1.

4.3.3 Factor of Safety: For all plain concrete slabs-on-ground design, a factor of safety must be applied to the loads in accordance with ACI 360 Section 5.9. The resistance factors specified for Type S structures do not apply.

4.4 Type P (Design Limits for Concrete Parking Lots):

4.4.1 Plain Concrete Method: When the modulus of rupture is required for design of plain concrete parking lots in accordance with Chapter 3 of ACI 330, the modulus of rupture \( (f_r) \) must be determined using Equation 5 and the values presented in Table 1. Factor of safety of the pavement design (reliability) must be in accordance with ACI 330 Appendix A provisions.

\[ f_r = L_f \sqrt{f'_c} \quad \text{(Equation 5)} \]

4.5 Installation: Helix® Micro Rebar™ reinforcements may be added to the concrete at the concrete batch plant or to the ready-mix truck at the jobsite. The manufacturer’s published installation instructions and this report must be strictly adhered to for adequate dispersal of fibers throughout the batch mixture. A copy of the manufacturer’s published installation instructions must be available at all times at the location of the Helix® Micro Rebar™ installation into the concrete.

4.6 Special Inspection: Periodic special inspection is required in accordance with Sections 1705.1.1 and 1705.3 of the IBC.

5.0 CONDITIONS OF USE

The Helix® Micro Rebar™ reinforcements described in this report comply with, or are suitable alternatives to, what is specified in those codes listed in Section 1.0 of this report, subject to the following conditions:

5.1 Helix® Micro Rebar™ reinforcements must be blended into the concrete mixture in accordance with the installation requirements in the ICC-ES evaluation report and the manufacturers published installation instructions.

5.2 When Helix® 5-25 Micro Rebar™ and Helix® 5-25U Micro Rebar™ reinforcements are added at the ready-mix plant, a batch ticket signed by a ready-mix representative shall be available to the code official upon request.

5.3 Type N applications must comply with Section 4.1 of this report. Joints as specified in Chapter 14.3.4 of ACI 318 (IBC and IRC) are required.

5.4 Design for Type S applications must follow Section 4.2 of this report.

5.5 Design for Type G applications must follow Section 4.3 of this report.

5.6 Design for Type P applications must follow Section 4.4 of this report.

5.7 The fire-resistance rating of constructions with Helix® Micro Rebar™ reinforcements have not been evaluated by ICC-ES and is outside the scope of this report. When requested, evidence of the fire-resistance rating of the construction must be submitted to the code official for their approval.

5.8 Special inspection must comply with Section 4.6 of this report.

5.9 Helix® Micro Rebar™ reinforcements are produced by Helix® Steel under an inspection program with inspections by ICC Evaluation Service, LLC.

6.0 EVIDENCE SUBMITTED

Data in accordance with the ICC-ES Acceptance Criteria for Use of Twisted Steel Micro-rebar (TSMR) in Concrete (AC470), approved May 2020 (editorially revised July 2020).

7.0 IDENTIFICATION

7.1 Each container of Helix® Micro Rebar™ reinforcement must bear the manufacturer’s name, trademark and address; the product name; and the ICC-ES evaluation report number (ESR-3949).
7.2 The report holder’s contact information is the following:

<td>10.22</td>
</tr>
</tbody>
</table>

For SI: \(1\) psi = 0.0069 MPa. \(1\) lb/yd\(^3\) = 0.59 kg/m\(^3\).

\(^1\) Interpolation between dosage rates and compressive strengths is permitted. Minimum of 24 MPa compressive strength is required under ADIBC Appendix L, Section 5.1.1.

\(^2\) Structures assigned to Seismic Design Category D, E or F must be in compliance with Section 14.1.4 of ACI 318, and combined flexure and axial compression must be considered in accordance with Section 14.5.4 of ACI 318.

\(^3\) RDP must calculate project-specific scale-effect factor (Equation 3) and multiple it with Table 1 values.

\(^4\) To convert Lf from psi to MPa, reported values must be multiplied by 0.083, which is \(\sqrt{0.0069}\).

</tbody>
</table>

For SI: 1 inch = 25.4 mm; 1 foot = 305 mm; 1 psf/ft = 0.1571 kPa/m; 1 psi = 6.895 kPa; 1 lb/yd³ = 0.593 kg/m³

**Notes:**

1. Applies to both cast-in-place walls with removable forms and flat ICF walls. Design and installation of Helix® 5-25 Micro-Rebar™ reinforced concrete must be in accordance with ESR-3949. Designs given in above table are Design “Type S”, and walls must conform to all applicable provisions of ESR-3949.

2. Concrete walls constructed in accordance with this Table must conform to the applicability limits of IRC Section R404.1.3.

3. Minimum specified compressive strength is 3000 psi unless compressive strength, f'c is denoted on the table (in psi).

4. Deflection criteria: L/240, where L is the height of the basement wall in inches. No soil surcharge allowed. Vertical bearing load is neglected and/or assumed to act at centerline of wall.

5. Interpolation is not permitted.

6. Backfill height is the difference in height between the exterior ground level and the top of the concrete footing that supports the foundation wall. Helix Steel designs assume a 4” thick slab above the top of footing. Walls must be laterally supported at top and bottom of wall before backfilling.

7. Soil classes are in accordance with the Unified Soil Classification System. Refer to IRC Table R405.1.

8. See IRC Table R608.3 for tolerance from nominal thickness permitted for flat walls.

9. Design under this table is limited to Seismic Design Categories A and B. Design for Seismic Design Categories C through F is outside the scope of this table and if required must be determined by registered design professional.

10. Reinforcement around wall openings must be provided in accordance with R404.1.3.3.7.3.

11. Dowels connecting footing to wall must be provided in accordance with IRC R404.1.3.3.7.8.

12. The Helix® 5-25 with reported dosage rate can be used in lieu of minimum horizontal reinforcement as permitted by Section 2.0 of this report.

13. The unsupported wall height is the wall height minus the interior floor slab thickness, assumed to be 4 inches thick.

14. † denotes an alternative dosage of 9 lb/yd³ with 3000 psi concrete may be used with wall returns. Returns shall be equal in thickness to the wall, extend minimum 28 inches in length perpendicular to the wall from the footing to 24 inches below grade.

15. The table is limited to building with maximum aspect ratio (length-to-width) of 3.6.
**Example 1: Basement Wall (Type S Design)**

<table>
<thead>
<tr>
